Homework

Course enrollment lookup | Due before Session 03

Business requirement

The training administrator needs to see which students are enrolled in a particular course. The application should accept a CourseId and display the enrolled students' IDs and names. If no enrollments are found, it should display a clear message.

Your task

After completing all TODOs, add this feature to the same application. Keep your completed TODOs in the file.

1. Ask for a positive CourseId. Reject invalid input before opening a connection.
2. Join Students with Enrollments and filter by the entered CourseId using a typed `@courseId` parameter (`SqlDbType.Int`).
3. Read all matching rows using `ExecuteReaderAsync()` and a `while (await reader.ReadAsync())` loop. Display each student's ID and name. If there are no rows, display **No enrollments found for this course ID.**

> **Test:** `101`, `99` and `abc`. Use a short `await using` connection scope.

Code Lab Submission

Submit one **Program.cs** file through the instructor's Google Classroom activity **before Session 03**. Include your name in a comment, your completed TODOs, the course enrollment lookup and the exception handlers demonstrated in the live session. Add a short comment explaining each parameter's name, SQL type and value.

Before you submit

- [ ] My student lookup handles existing IDs, missing IDs and invalid input.
- [ ] I tested the course enrollment lookup with 101, 99 and abc.
- [ ] I can explain the parameters used in both lookups.
- [ ] I can identify where the reader and connection are disposed.
- [ ] I added the `InvalidCastException` and `InvalidOperationException` catch blocks demonstrated in the live session, with a helpful message for each error and a short comment explaining what it handles.
